Steelworker for the Future

Partnership between Lakeland Community College and ArcelorMittal

The Steelworker for the Future partnership empowers you in two ways: It provides up to two summer internships that will help to pay for your degree, and this experience makes you employable upon graduation by providing you with real-world work experience.

Requirements:

To be considered, you must have a high school diploma (or equivalent), you must apply for admission and be accepted, and you must pass a drug screening test for the internship.

Then, you must enroll in either the electronic engineering technology department's industrial electronics program or enroll in the computer integrated manufacturing department's maintenance and repair program.

About the program:

Both degreed programs require four semesters of classroom training at Lakeland Community College where you will earn an Associate of Applied Sciences degree. There is also the opportunity for up to 16 weeks of on-site training at ArcelorMittal. During the on-site portion of the program, you'll apply what you learn in class and earn credit toward your degree. You'll also encounter mentoring opportunities – not to mention earning enough in wages to help pay for your tuition.

Benefits:

As a graduate of the Steelworker for the Future partnership, you'll receive an Associate of Applied Science degree in either Industrial Electronics or Maintenance and Repair.

But best of all, you'll have the tools you need to shape your own future. In fact, you could start at ArcelorMittal earning nearly \$20 per hour with attractive vacation time, medical benefits, a 401(k) plan and profit sharing. By the third year of employment, you could join the average graduate earning \$90,000 annually.
